LDAC Summary

PLENARY SESSIONS

Plenary sessions include research papers, with the following presentations:

Session 1 - Digital Twinning and Asset Management (Thu 15/06. 10:30 -

for the life cycle assessment of built assets

Ivain Kubicki, Tomas Navarrete Gutierrez and Thomas Beach

Abstract: Life Cycle Assessment (LCA) is a scientific method for the quantification of environmental impacts important for sustainable design and management of our built environment. Conducting LCA on buildings requires contextualized information which can be sourced from the Building Information Model (BIM) or more generally. Interoperability between LCA domain tools and BIM tools is lacking. Our motivation lies in semantically linking different domains by adopting a Semantic Web (SW) technologies. This would result in increased integrated automation of information pipelines and more explainable impacts of complex contexts. In this paper we present progress under the SemanticLCA ontology where we modelled several use cases for LCA of built assets. We present one case study at the building level, highlighting the semantic alignments between BIM models and LCA. The paper discusses the implementation challenges and offers suggestions on how such an ontology could be developed.

Abstract

It is accepted in the Linked Data for Architecture and Construction (LDAC) community that generating knowledge graphs (KGs) from the BIM model of a building enables higher level use cases such as integration with geographic information systems, operational system integration, semantic digital twins (DTs), or automatic compliance checking. However, existing approaches generate a large, monolithic knowledge graph that is difficult to integrate with other knowledge such as Thing Descriptions (TDs) of Internet of Things (IoT) devices, or information about office occupants and room occupancy schedules. In this work, we describe a set of three modular knowledge graphs that enable knowledge integration for the semantic DT of our building at Mines Saint-Étienne, leveraging the principles of Linked Building Data: (1) KG_{LBD} is automatically generated from the Revit model of our building, (2) KG_{POAF} is semi-automatically generated from the employee directory of Mines Saint-Étienne, and (3) KG_{TD} is automatically generated from the ETS5 project file describing the KNX network in our building using the W3C TD ontology, and points to real-time and historical data. Our approach offers an alternative with respect to the state of the art such that: (1) relevant bits of the building's KG can be accessed using a simple REST-like interface, where each small KG contains links to other entities that themselves are identified by an IRI and have a small KG accessible; (2) Knowledge potentially served by different servers can be integrated in the same solution; (3) simple access control can be implemented for some parts of the global KG.

dstv: An ontology-based extension of the DSTV-NC standard for the use of linked data in the automation of steel construction

Lukas Kirner¹, Jyrki Oraskari², Victoria Jung³ and Sigrid Brell-Cokcan⁴

^{1,2,3,4}*Chair of Individualized Production (IP), RWTH Aachen University Campus-Boulevard 30, 52074 Aachen, Germany*

Abstract

To meet the demands of automated steel construction, there is a need for innovative ways to link process data, measured deviations, and tolerances. Our current research in robotic steel fabrication aims to tackle this challenge by creating an adaptable information model interface that can seamlessly incorporate cross-process considerations required for precise and efficient fabrication beyond current Building Information Modeling (BIM). The goal is to improve existing information interfaces and increase the utilization of flexible and partially automated robot concepts in steel construction. Our approach uses existing standards and product interfaces such as DSTV-NC in steel construction, which we convert and enhance through an ontology that includes tolerances and process parameters. The outcomes of our study contribute to the development of automated systems in construction and support small and medium-sized enterprises in steel construction by addressing challenges related to skills shortages, productivity, and occupational safety.
